
Damage evolution of spring 1 (loading vs unloading)
damage d
u1 [mm]
trial damage, loading curve
dynamic path (time ordered)
static
dynamic, loading: on the curve
dynamic, unloading: d frozen, off the curve

Same, 1 - d on a log scale: the post-rupture oscillation at constant d
1 - d (log scale, floored at 1e-10 = numerically d = 1)
u1 [mm]
after rupture the mass oscillates:
u1 sweeps back and forth at d = 1
